

INSTITUT PASTEUR COURSE - EDUCATION CENTER

Vaccinology

Institut Pasteur, Paris, February 6 to March 1, 2023

This in-person four-week course offers an integrated overview of vaccinology, by covering all the key issues of vaccine development from design to delivery to the populations in industrialized and developing countries. It aims at providing the attendees with the knowledge required to become future actors of the international vaccine community. In addition, the worldwide network built-up by the participants over the years helps the emergence of regional/international collaborations.

The course comprises three modules:

Module 1 : Key steps from epidemiology to clinical trials

Module 2 : Update of vaccine development against major infectious diseases and future challenges

Module 3: An international symposium organized at Institut Pasteur Paris on: "Vaccine development: the pre- and post-COVID-19 vaccine era".

The course also includes a workshop during which the participants work in groups to design a vaccine candidate. Thanks to a partnership with the HSeT Foundation, an e-learning website dedicated to the course has been created.

Personalized tutoring is also provided. This course is dedicated to individuals with medical or scientific training who are interested in all aspects of vaccinology: medical and public health students, PhD students (e.g., immunology, microbiology), scientists, physicians, pharmacists, veterinarians and other health professionals.

Fellowships will be available.

Please, refer to the website of the course for further information.
